

# Normal forms and complete relations for several classes of circuits

Xiaoning Bian

Department of Computer Science and Technology  
Tsinghua University

Presented at Quantum PLT seminar, DCST, Tsinghua U  
Oct 16, 2025

# Contents

## Goals

### 6 classes of circuits (classical and quantum)

- Permutations

- $C_m^n \rtimes S_n$

- Linear permutations and affine permutations

- CNOT+Dihedral

- Clifford

- Qutrit Clifford

## Demo

### Current and possible future work

### Some similar works

# Goals

- ▶ An introduction for circuit normal form and circuit rewriting.
- ▶ Formalizing some easy cases in Agda.
- ▶ A better understanding of quantum circuits.

## 6 classes of circuits (classical and quantum)

- ▶ In 2003, Lafont first gave the theory and several examples [2]. We will learn 2 examples from it.
  - ▶ Circuits of permutations and even permutations.
  - ▶ Circuits of linear permutations and affine permutations.
- ▶ In 2015, Selinger gave normal forms and complete relations for Clifford circuits [4].
- ▶ In 2019, Amy, **Jianxin Chen**, and Ross dittoed for CNOT-Dihedral circuits [1].
- ▶ In 2024, Bian did the same for  $C_m^n \rtimes S_n$  in Agda, unpublished.
- ▶ In 2025, Li et al. did the same for qutrit Clifford circuits [3].

Note: this is not a full list of related work.

## Permutations — $S_2$

permutation of two items.

$S_2 \cong C_2$ , cyclic group of order 2.

Consider a circuit consists of  $\sigma$ ,  $\text{id}$ , e.g.

## Permutations — $S_2$

$$\overline{\text{X}} \cdot \text{---} = \text{---} \cdot \overline{\text{X}} \cdot \overline{\text{X}} \quad (\text{cir 1})$$

by looking at the action on two items, we know

$$(\text{order}): \quad \overline{\text{X}} \cdot \overline{\text{X}} = \overset{1}{\text{---}} \overset{1}{\text{---}} \overset{2}{\text{---}} \overset{2}{\text{---}} = \overset{1}{\text{---}} \overset{1}{\text{---}} \overset{2}{\text{---}} \overset{2}{\text{---}}$$

using order rule, cir 1 rewrite to

$$\overline{\text{X}} \cdot \text{---}$$

## Permutations — $S_2$

We say  $\{\sigma, \text{id}\}$  are normal forms for  $S_2$   
and  $\{\text{X-X} = \text{--}\}$  is a complete set of  
relations for  $S_2$ . It is complete because  
any other circuit rewrite to a unique normal  
form using rewrite rules from this set.

## Permutations — $S_3$

$S_3$  is generated by

$|S_3| = 3! = 6$ .  $S_3$  has 6 elements:

## Permutations — $S_3$

We say  $S_3$  has normal forms  $\{①, \dots, ⑥\}$ .

Claim:  $\{①, ②, ③\}$  are complete, where.

$$① \quad \overline{\text{X X}} = \equiv, \quad ② \quad \overline{\text{X X X}} = \equiv,$$

$$③ \quad \begin{array}{c} 1 \\ 2 \\ 3 \end{array} \overline{\text{X X X}} \begin{array}{c} 3 \\ 2 \\ 1 \end{array} = \begin{array}{c} 1 \\ 2 \\ 3 \end{array} \overline{\text{X X X}} \begin{array}{c} 3 \\ 2 \\ 1 \end{array}.$$

NOTE: Soundness can be checked by looking at their actions.

## Permutations — $S_3$

proof : Consider a circuit with  $n$  gates.

## Permutations — $S_3$

So, essentially we need to show for each

$\sigma \in \{\sigma_1, \sigma_2\}$ , and each  $y \in \{1, \dots, 6\}$ ,  $\exists y' \in \{1, \dots, 6\}$

# Permutations — $S_3$

using only rules (a) (b) (c).

St.  $x \cdot y \rightarrow y'$ . There are  $2 \cdot 6 = 12$  Cases.

e.g.  $\sigma_1$  (b)  $\xrightarrow{(a)}$  (4)

e.g.  $\sigma_2$  (3)  $\xrightarrow{(c)}$  (5)

etc. so  $\{(a), (b), (c)\}$  is complete  $\square$ .

## Permutations — $S_n$

$\overline{\overline{X}}$  and  $\overline{X}$  are similar, they are built from basic parts  $\overline{\quad}$  and  $X$ , through "vertical composition". Likewise, rule (a) and (b) are similar, they are just order rules.

## Permutations — $S_n$

- This is the main feature of circuit rewriting.

Compared to string rewriting, where you only have "1-dim" rewriting, e.g. "abcd"  $\rightarrow$  "xyz".

- "Vertical structure" is also quite restrictive.

You don't have rule like

except when you have

## Permutations — $S_n$

the equality from horizontal rewriting.

- But you are allowed to "slide"

$$\begin{array}{c} \boxed{f} \\ \hline \end{array} \begin{array}{c} \hline \\ \boxed{g} \end{array} = \begin{array}{c} \hline \boxed{f} \\ \hline \end{array} \begin{array}{c} \hline \\ \boxed{g} \end{array}$$

This is actually a "structure" rule meaning they are built in, no need to explicitly mention them.

## Permutations — $S_n$

Lafont 2003 formalized this idea using Category theory. The vertical composition is a monoidal structure.

Recall Bonan introduced monad last week, and a famous quote "a monad is just a monoid in the category of endofunctors". To define.

## Permutations — $S_n$

"monord", monoidal structure is needed.

The takeaway is : monoidal, monad, moniod  
are related to structure of the form

$$\{ A \times A \xrightarrow{\bullet} A, \quad \varepsilon, \quad \bullet\text{-associative}, \quad \varepsilon\text{-left/right-identity} \}$$

Lafont 2003 also has several examples:  $S_n, A_n, \dots$

## Permutations — $S_n$

$S_n$ , using the vertical composition idea, is a groupoid, generated by  $\boxed{X}$ . All possible

↑  
Something like a group

padding, on top of, and under  $\boxed{X}$ , e.g.  $\begin{array}{c} \hline \boxed{X} \\ \hline \end{array}$ ,  $\overline{\boxed{X}}$

are now "built in" through the monoid structure.

Likewise, the "sliding rule" are built in, too.

## Permutations — $S_n$

$S_n$  has normal forms (nfs) :

$$\begin{array}{c}
 \begin{array}{|c|} \hline S_n \\ \hline \end{array} = \begin{array}{|c|} \hline C_n \\ \hline \end{array} \begin{array}{|c|} \hline S_{n-1} \\ \hline \text{NF} \end{array} \quad \swarrow S_{n-1} \text{ in normal form} \\
 \uparrow \\
 \text{fixed } n \text{ coset representatives}
 \end{array}$$

$$= \begin{array}{|c|} \hline C_n \\ \hline \end{array} \begin{array}{|c|} \hline C_{n-1} \\ \hline \end{array} \begin{array}{|c|} \hline C_{n-2} \\ \hline \end{array} \begin{array}{|c|} \hline \square \\ \hline \end{array} \quad \nwarrow \text{id.}$$

## Permutations — $S_n$

e.g.  $S_3/S_2$  ..  $S_2 = \{ \text{X}, = \}$

$$S_3 = \left\{ \begin{array}{ll} \textcircled{1} \text{ X } \\ \text{X } \end{array}, \begin{array}{ll} \textcircled{2} \text{ } \\ \text{X } \end{array}, \begin{array}{ll} \textcircled{3} \text{ X } \\ \text{X } \end{array}, \begin{array}{ll} \textcircled{4} \text{ X } \\ \text{X } \end{array}, \right.$$

$$\left. \begin{array}{ll} \textcircled{5} \text{ X } \\ \text{X } \end{array}, \begin{array}{ll} \textcircled{6} \text{ } \\ \text{X } \end{array} \right\}$$

Can you spot the factorization?

$$\boxed{S_3} = \boxed{C_3} \boxed{S_2}$$

# Permutations — $S_n$

|   | $S_3$ | $C$ | $S_2$ |
|---|-------|-----|-------|
| ① |       |     |       |
| ② |       |     |       |
| ③ |       |     |       |
| ④ |       |     |       |
| ⑤ |       |     |       |
| ⑥ |       |     |       |

$$C_3 = \{ \equiv, \overline{x}, x\overline{x} \}$$

$$C_n = \left\{ \begin{array}{c} \equiv \\ \vdots \\ \overline{x} \end{array}, \begin{array}{c} \equiv \\ \vdots \\ \overline{x} \end{array}, \begin{array}{c} \equiv \\ \vdots \\ \overline{x} \end{array}, \dots \right\}$$

$$\left\{ \begin{array}{c} x \\ x \\ x \\ \vdots \\ x \end{array} \right\}$$

↑  
(n-1)σ's on n-wires.

# Permutations — $S_n$

so,

claim.  $\left\{ \begin{array}{l} \text{crossing} = \text{identity} \\ \text{commutative} \end{array} \right\}$

The first part shows two crossing lines equal to two parallel lines. The second part shows two parallel lines with a crossing box equal to two parallel lines with a crossing box, labeled "comm".

Yang-Baxter rule:  $\text{crossing} = \text{crossing}$

If  $A = B$ , then  $\begin{array}{c} \vdots \\ A \\ \vdots \end{array} = \begin{array}{c} \vdots \\ B \\ \vdots \end{array}$  is complete.

↑ vcong.

## Permutations — $S_n$

In groupoid setting, no need to mention  
rule (comm) & (vcong).

Like before. we show for-all  $\sigma_i$ , and all  $nf$ s,  $\exists nf'$

$$\sigma_i \cdot nf \rightarrow nf'$$

There are 4 cases of this concatenation.

# Permutations — $S_n$

$\Rightarrow$

# Permutations — $S_n$

## Even permutations — $A_n$

$A_n$  is generated by  $\left\{ \overline{\overline{X}} = \overline{\overline{X}} \right\}$ .

$A_n \leq S_n$  of index 2, i.e. half of  $S_n$  are even.

NFs :

## Even permutations — $A_n$

Even permutations —  $A_n$

Complete  
relations :

}

,

,

}

proof of completeness, see Lafont 2003. More complicated than  
one think.

$$|C_n| = 1 + (n-2) + 1 = n \text{ for } n \geq 3.$$
$$|A_n| = n!/2, \quad |C_2| = 1.$$

$C_m^n \rtimes S_n$  — NF construction, direct product, semidirect product.

e.g.

e.g.

$$C_m^n \rtimes S_n$$

Complete relations consists of three parts.

① rels for  $G_1$

② rels for  $G_2$

③ commuting rules of  $G_1$  and  $G_2$ . i.e. sliding.

(implicit in monoidal setting)

$$C_m^n \rtimes S_n$$

e.g.  $C_2$  generated by  $a$

$\times$

$C_3$  generated by  $b$

$$\text{rels} = \{ a^2 = e, b^3 = e, ab = ba \}$$

$$= \left\{ \begin{array}{c} \text{---} \boxed{a} \text{---} \boxed{a} \text{---} \\ \text{---} \\ \text{---} \end{array} \right. , \quad \left\{ \begin{array}{c} \text{---} \\ \text{---} \boxed{b} \text{---} \boxed{b} \text{---} \boxed{b} \text{---} \\ \text{---} \\ \text{---} \end{array} \right. , \quad \left\{ \begin{array}{c} \text{---} \boxed{a} \text{---} \\ \text{---} \boxed{b} \text{---} \\ \text{---} \\ \text{---} \boxed{a} \text{---} \\ \text{---} \boxed{b} \text{---} \end{array} \right\}$$

$C_m^n \rtimes S_n$  — NF, Rel Construction —  $N$  times direct product.

$$\begin{array}{c}
 \boxed{G} \\
 \times \\
 \boxed{G} \\
 \times \\
 \boxed{G} \\
 \times \\
 \vdots \\
 \boxed{G}
 \end{array}
 =
 \begin{array}{c}
 \boxed{G_{NF}} \\
 \\
 \boxed{G_{NF}} \\
 \vdots \\
 \boxed{G_{NF}}
 \end{array}$$

If we know product  
of two groups, we  
know product of  
 $N$  groups by induction.

$C_m^n \rtimes S_n$  — NF, Rel, construction — Semidirect product.

e.g.  $C_m^n \rtimes S_n$

↑

↑

generators  $\{ \tau, \sigma \}$

relation  $\left\{ \begin{array}{l} \textcircled{1} S_n \text{ rels } \checkmark \\ \textcircled{2} C_m^n \text{ rels } \checkmark \\ \textcircled{3} \text{ Semidirect rels } \end{array} \right.$

and

"semi-commute"

$$C_m^n \rtimes S_n$$

NF<sub>S</sub>

$$C_m^n \rtimes S_n =$$

The diagram illustrates the wreath product  $C_m^n \rtimes S_n$  as a semidirect product of two normal subgroups. It consists of two rectangular boxes connected by an equals sign. The left box is labeled  $C_m^n$  at the top and  $NF$  at the bottom. It has four horizontal lines on its left side and four on its right side. The right box is labeled  $S_n$  at the top and  $NF$  at the bottom. It has four horizontal lines on its top side and four on its bottom side. A double-headed arrow connects the right side of the left box to the left side of the right box, indicating a conjugation action.

Linear permutations —  $GL_n(\mathbb{Z}_2)$  Now, something more interesting.

General Linear maps over field  $\mathbb{Z}_2$ .

$$GL_n(\mathbb{Z}_2) = \{ f: \mathbb{Z}_2^n \rightarrow \mathbb{Z}_2^n \mid f \text{ linear and invertible} \}$$

e.g.  $GL_1(\mathbb{Z}_2) = \{ \text{id} \}$ . NOTE: negation is not linear.

e.g.  $GL_2(\mathbb{Z}_2) = \left\{ \begin{array}{c} x \xrightarrow{\quad} y \\ y \xrightarrow{\quad} x \end{array} ; \begin{array}{c} x \xrightarrow{\quad} y \\ y \xrightarrow{\quad} x+y \end{array} ; \begin{array}{c} x \xrightarrow{\quad} x+y \\ y \xrightarrow{\quad} x \end{array} , \text{ etc} \right\}$

# Linear permutations — $GL_n(\mathbb{Z}_2)$

e.g.  $GL_2(\mathbb{Z}_2) = \left\{ \begin{array}{c} x \text{---} y \\ y \text{---} x \end{array}, \begin{array}{c} x \text{---} y \\ y \text{---} x+y \end{array}, \begin{array}{c} x \text{---} x+y \\ y \text{---} x \end{array}, \text{etc.} \right\}$

$$xy \mapsto yx$$

$$00 \text{ --- } 00$$

$$01 \text{ --- } 10$$

$$10 \text{ --- } 01$$

$$11 \text{ --- } 00$$

$S_{2^n} \ni$   
one particular  
element of  $S_{2^n}$

## Linear permutations — $GL_n(\mathbb{Z}_2)$

 permute bases.

So they are linear & invertible.

Theorem 6. (Lafont 2003).  $GL_n(\mathbb{Z}_2)$  is presented  
by  $(\{ \text{crossing}, \text{crossing with dot} \}, 6 \text{ rels})$ .

I did an implementation using Haskell. Demo.

## Linear permutations — $GL_n(\mathbb{Z}_2)$

$NF_5$ : this time, we use right cosets.

$$G_n \cong \begin{matrix} G_{n-1} \\ NF \end{matrix} C_n$$

$$|C_n| = 2^{n-1} \cdot \sum_{k=1}^{n-1} 2^k$$

e.g.

e.g.

# Linear permutations — $GL_n(\mathbb{Z}_2)$

## Linear permutations — $GL_n(\mathbb{Z}_2)$

6 rels :

proof, see Lafont 2003.

Affine permutations —  $GA_n(\mathbb{Z}_2)$  — adding negation, we get affine.

Theorem 11 (Lafont 2003).  $GA_n(\mathbb{Z}_2)$  is presented by

$$\left( \{ \overline{x}, \underline{x}, \rightarrow \}, 6 + 1 + 2 \text{ rels.} \right).$$

Actually  $GA_n(\mathbb{Z}_2) = C_2^n \rtimes GL_n(\mathbb{Z}_2)$ , so its =

rels consists of 3 parts  $\left\{ \begin{array}{l} \textcircled{1} 6 \text{ for } GL_n(\mathbb{Z}_2) \\ \textcircled{2} 1 \text{ for } C_2^n \\ \textcircled{3} 2 \text{ for semidirect product.} \end{array} \right.$

# Affine permutations — $GA_n(\mathbb{Z}_2)$

rels

NF<sub>S</sub>

CNOT+Dihedral — now Chen et al.'s work.

CNOT + Dihedral = Circuits over gate set  $\{CNOT, X, T\}$ .  
 $\subseteq$  Clifford+T.

- $\{T, X\}$  generates the dihedral group of order 16 mod scalar.

Complete rels is  $\{T^8 = \epsilon, X^2 = \epsilon, XT = T^{-1}X\}$ .

- In general, Dihedral group of order  $2n$  consists of

Symmetries of  $n$ -polygon.

$$\text{and } XTX = T^{-1}$$

## CNOT+Dihedral

They use two facts:

- The group  $G$  generated by  $\{ \oplus, \otimes \}$  is  $GA_n(\mathbb{Z}_2)$ .

- To see,  $\overline{X} = \oplus \oplus \oplus$ ,  $\overline{X} = \oplus \oplus$

$$\overline{X} = -\oplus$$

- and,  $\oplus = \overline{X} \overline{X}$ ,  $\oplus = \overline{X}$

- $CNOT+Dihedral = M \rtimes G$ , where  $M \leq G_8^{2^n}$ .

# CNOT+Dihedral

NFs:  $\mathcal{M}$  NF  $\mathcal{G}A_n$  NF. For  $\mathcal{M}_{NF}$ , let

and

# CNOT+Dihedral

where  $\mathcal{V} = \{T^k, k=0, \dots, 7\}$ .

# CNOT+Dihedral — Complete relations, 3 parts.

①  $GA_n(\mathbb{Z}_2)$  rels

$R_1 - R_6$  . 6 rels vs 9 of Lafont .

②  $M$  rels,  $R_7 - R_{10}$

③ Semidirect rels

$R_{11} - R_{13}$  .

Clifford - Selinger's work.

Clifford circuits are generated by  $\{H, S, \oplus\} = \{H, S, \uparrow\}$   
 $\uparrow$   
 $\oplus = H \uparrow H$

We see  $\{\oplus, S\} \leq \{\oplus, T\}$

- Trying to first solve  $\{\oplus, S\}$  problem like Chen et al did.

Then solve  $\{\oplus, S, H\}$  might be an interesting project.

Selinger did in a different way.

# Clifford $\sim NF_S$ .

**Definition 4.3.** We say that an  $n$ -qubit circuit is  $Z$ -normal if it is of the form

for  $1 \leq m \leq n$ . We say that an  $n$ -qubit circuit is  $X$ -normal if it is of the form

Finally, an  $n$ -qubit circuit is *normal* if it is of the form

# Clifford — Rels.

$$H^2 = 1$$

$$S^4 = 1$$

$$SHSHSH = \omega$$

• all vertically symmetric.

• See paper for proofs.

• Other techniques are used.

# Qutrit Clifford — $NF_3$ and Rels.

•  $NF_3$  are almost identical.

• We expect rels are also almost identical.

• I further simplified these rels, now they are as expected.

• We are trying to extend the result to qutrit.

## Current and possible future work

- ▶ Current work:
  - ▶ Simplify Li et al.'s relations. Almost done. We get simplified relations that are similar to Selinger's which enjoys the “vertical symmetry” property.
  - ▶ Normal forms and complete relations for qubit Clifford. Joint work with Li et al.
    - ▶ Normal form: done.
    - ▶ Collecting relations and relation simplification: in progress.
- ▶ Possible future projects:
  - ▶ Formalizing the results introduced today in Agda.
  - ▶ Normal forms and complete relations for other classes of circuits, in particular, the classes in honor of mentions (next slide).

## Some honorary mentions

- In 2008, Matsumoto et al. gave normal forms for 1-qubit Clifford+T circuits.

$$(T \mid \varepsilon) (HT \mid SHT)^* \mathcal{C}$$

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}, \quad S = \begin{pmatrix} 1 & 0 \\ 0 & i \end{pmatrix}, \quad T = \begin{pmatrix} 1 & 0 \\ 0 & e^{i\pi/4} \end{pmatrix}, \quad \omega = e^{i\pi/4}.$$

- In 2019, Glaudell et al. gave normal forms for 1-qutrit Clifford+T circuits.

$$(\varepsilon \mid T \mid H^2 T) (HT \mid H^3 T \mid SHT \mid SH^3 T \mid S^2 HT \mid S^2 H^3 T)^* \mathcal{C}.$$

- In 2021, Glaudell et al. gave normal forms for 2-qubit Clifford+CS circuits.

$$\bar{U} = \bar{R}_k \cdots \bar{R}_1 \cdot \bar{C}$$

- In 2023, Longcheng Li et al. gave almost-normal forms 2-qubit Clifford+T circuits, similar to 2-qubit Clifford+CS.
- In 2023, Bian et al. gave almost-normal forms and complete relations for 3-qubit Clifford+CS circuits.

$$ce_4 e_3 e_2 e_1 ce_4 e_3 e_2 e_1 \dots ce_4 e_3 e_2 e_1 c \overline{CQD}.$$
